

## AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

### Listing of Claims:

1           1.       (Currently amended) A method for reducing the overhead involved  
2       in executing native code methods in an application running on a virtual machine,  
3       comprising:  
4           selecting a call to any native code method to be optimized within the  
5       virtual machine;  
6           decompiling at least part of the selected native code method into an  
7       intermediate representation, wherein an intermediate representation includes a set  
8       of instruction code which is not in final executable form;  
9           obtaining an intermediate representation associated with the application  
10       running on the virtual machine which interacts with the selected native code  
11       method;  
12           integrating the intermediate representation for the selected native code  
13       method into the intermediate representation associated with the application  
14       running on the virtual machine to form an integrated intermediate representation;  
15       and  
16           generating native code from the integrated intermediate representation,  
17       wherein the native code generation process optimizes interactions between the  
18       application running on the virtual machine and the selected native code method,  
19       wherein optimizing the interactions involves optimizing calls from the application  
20       to the selected native code method by using additional information from the  
21       integrated intermediate representation to reduce the number of indirect calls and

22 indirect references associated with the calls from the application to the selected  
23 native code method.

1           2.       (Currently amended) The method of claim 1, wherein selecting the  
2 call ~~to the~~ to any native code method involves selecting the call based upon at  
3 least one of:  
4           the execution frequency of the call; and  
5           the overhead involved in performing the call to the selected native code  
6 method as compared against the amount of work performed by the selected native  
7 code method.

1           3        (Canceled).

1           4.       (Currently amended) The method of claim 1, wherein optimizing  
2 interactions between the application running on the virtual machine and the  
3 selected native code method involves optimizing callbacks by the selected native  
4 code method into the virtual machine.

1           5.       (Currently amended) The method of claim 4, wherein optimizing  
2 callbacks by the selected native code method into the virtual machine involves  
3 optimizing callbacks that access heap objects within the virtual machine.

1           6.       (Currently amended) The method of claim 4, wherein the virtual  
2 machine is a platform-independent virtual machine; and  
3           wherein ~~combining~~ integrating the intermediate representation for the  
4 selected native code method with the intermediate representation associated with  
5 the application running on the virtual machine involves integrating calls provided  
6 by an interface for accessing native code into the selected native code method.

1           7.       (Original) The method of claim 1, wherein obtaining the  
2 intermediate representation associated with the application running on the virtual  
3 machine involves recompiling a corresponding portion of the application.

1           8.       (Original) The method of claim 1, wherein obtaining the  
2 intermediate representation associated the application running on the virtual  
3 machine involves accessing a previously generated intermediate representation  
4 associated with the application running on the virtual machine.

1           9.       (Currently amended) The method of claim 1, wherein prior to  
2 decompiling the selected native code method, the method further comprises  
3 setting up a context for the decompilation by:  
4           determining a signature of the call to the selected native code method; and  
5           determining a mapping from arguments of the call to corresponding  
6 locations in a native application binary interface (ABI).

1           10.      (Currently amended) A computer-readable storage device storing  
2 instructions that when executed by a computer cause the computer to perform a  
3 method for reducing the overhead involved in executing native code methods in  
4 an application running on a virtual machine, the method comprising:  
5           selecting a call to any native code method to be optimized within the  
6 virtual machine;  
7           decompiling at least part of the selected native code method into an  
8 intermediate representation, wherein an intermediate representation includes a set  
9 of instruction code which is not in final executable form;

10 obtaining an intermediate representation associated with the application  
11 running on the virtual machine which interacts with the selected native code  
12 method;  
13 integrating the intermediate representation for the selected native code  
14 method into the intermediate representation associated with the application  
15 running on the virtual machine to form an integrated intermediate representation;  
16 and  
17 generating native code from the integrated intermediate representation,  
18 wherein the native code generation process optimizes interactions between the  
19 application running on the virtual machine and the selected native code method,  
20 wherein optimizing the interactions involves optimizing calls from the application  
21 to the selected native code method by using additional information from the  
22 integrated intermediate representation to reduce the number of indirect calls and  
23 indirect references associated with the calls from the application to the selected  
24 native code method.

1 11. (Currently amended) The computer-readable storage device of  
2 claim 10, wherein selecting the call ~~to the~~ to any native code method involves  
3 selecting the call based upon at least one of:  
4 the execution frequency of the call; and  
5 the overhead involved in performing the call to the selected native code  
6 method as compared against the amount of work performed by the selected native  
7 code method.

1 12 (Canceled).

1 13. (Currently amended) The computer-readable storage device of  
2 claim 10, wherein optimizing interactions between the application running on the

3 virtual machine and the selected native code method involves optimizing  
4 callbacks by the selected native code method into the virtual machine.

1 14. (Currently amended) The computer-readable storage device of  
2 claim 13, wherein optimizing callbacks by the selected native code method into  
3 the virtual machine involves optimizing callbacks that access heap objects within  
4 the virtual machine.

1 15. (Currently amended) The computer-readable storage device of  
2 claim 13,  
3 wherein the virtual machine is a platform-independent virtual machine;  
4 and  
5 wherein ~~combining~~ integrating the intermediate representation for the  
6 selected native code method with the intermediate representation associated with  
7 the application running on the virtual machine involves integrating calls provided  
8 by an interface for accessing native code into the selected native code method.

1 16. (Previously presented) The computer-readable storage device of  
2 claim 10, wherein obtaining the intermediate representation associated with the  
3 application running on the virtual machine involves recompiling a corresponding  
4 portion of the application.

1 17. (Previously presented) The computer-readable storage device of  
2 claim 10, wherein obtaining the intermediate representation associated with the  
3 application running on the virtual machine involves accessing a previously  
4 generated intermediate representation associated with the application running on  
5 the virtual machine.

1           18.     (Currently amended) The computer-readable storage device of  
2     claim 10, wherein prior to decompiling the selected native code method, the  
3     method further comprises setting up a context for the decompilation by:  
4                 determining a signature of the call to the selected native code method; and  
5                 determining a mapping from arguments of the call to corresponding  
6     locations in a native application binary interface (ABI).

1           19-27. (Cancelled)

1           28.     (Currently amended) A method for reducing the overhead involved  
2     in executing native code methods in an application running on a virtual machine,  
3     comprising:  
4                 deciding to optimize a callback by any native code method into the virtual  
5     machine;  
6                 decompiling at least part of the selected native code method into an  
7     intermediate representation, wherein an intermediate representation includes a set  
8     of instruction code which is not in final executable form;  
9                 obtaining an intermediate representation associated with the application  
10    running on the virtual machine which interacts with the selected native code  
11    method;  
12                integrating the intermediate representation for the selected native code  
13    method into the intermediate representation associated with the application  
14    running on the virtual machine to form an integrated intermediate representation;  
15    and  
16                generating native code from the integrated intermediate representation,  
17    wherein the native code generation process optimizes the callback ~~by the~~ by any  
18    native code method into the virtual machine, wherein optimizing the ~~interactions~~  
19    callback involves optimizing calls from the ~~application to the~~ selected native code

20 method to the application by using additional information from the integrated  
21 intermediate representation to reduce the number of indirect calls and indirect  
22 references associated with the calls from the selected native code method to the  
23 application.

1 29. (Currently amended) The method of claim 28, wherein the native  
2 code generation process also optimizes calls to the selected native code method  
3 by the application.

1 30. (Currently amended) The method of claim 28, wherein optimizing  
2 the callback ~~by the~~ by any native code method into the virtual machine involves  
3 optimizing a callback that accesses a heap object within the virtual machine.

1 31. (Currently amended) The method of claim 28,  
2 wherein the virtual machine is a platform-independent virtual machine;  
3 and  
4 wherein ~~combining-integrating~~ the intermediate representation for the  
5 selected native code method with the intermediate representation associated with  
6 the application running on the virtual machine involves integrating calls provided  
7 by an interface for accessing native code into the selected native code method.

1 32. (Currently amended) A computer-readable storage device storing  
2 instructions that when executed by a computer cause the computer to perform a  
3 method for reducing the overhead involved in executing native code methods in  
4 an application running on a virtual machine, the method comprising:  
5 deciding to optimize a callback by any native code method into the virtual  
6 machine;

7           decompiling at least part of the selected native code method into an  
8     intermediate representation, wherein an intermediate representation includes a set  
9     of instruction code which is not in final executable form;

10          obtaining an intermediate representation associated with the application  
11     running on the virtual machine which interacts with the selected native code  
12     method;

13          integrating the intermediate representation for the selected native code  
14     method into the intermediate representation associated with the application  
15     running on the virtual machine to form an integrated intermediate representation;  
16     and

17          generating native code from the combined intermediate representation,  
18     wherein the native code generation process optimizes the callback ~~by the~~ by any  
19     native code method into the virtual machine, wherein optimizing the ~~interactions~~  
20     callback involves optimizing calls from the ~~application to the~~ selected native code  
21     method to the application by using additional information from the integrated  
22     intermediate representation to reduce the number of indirect calls and indirect  
23     references associated with the calls from the selected native code method to the  
24     application.

1           33.     (Currently amended) The computer-readable storage device of  
2     claim 32, wherein the native code generation process also optimizes calls to the  
3     selected native code method by the application.

1           34.     (Currently amended) The computer-readable storage device of  
2     claim 32, wherein optimizing the callback ~~by the~~ by any native code method into  
3     the virtual machine involves optimizing a callback that accesses a heap object  
4     within the virtual machine.

1           35.     (Currently amended) The computer-readable storage device of  
2     claim 32, wherein the virtual machine is a platform-independent virtual machine;  
3     and  
4           wherein ~~combining~~ integrating the intermediate representation for the  
5     selected native code method with the intermediate representation associated with  
6     the application running on the virtual machine involves integrating calls provided  
7     by an interface for accessing native code into the selected native code method.

1           36-39. (Canceled)
